Ghislaine Boddington is a future thinker recognised internationally since the early 90’s as a thought leader and global pioneer advocating the use of the entire body as a digital interaction canvas. She is the Creative Director of body>data>space a London design unit creating innovative connections between performance, architecture, virtual worlds and new media, placing the body at the centre of digital interaction.

Ghislaine explores the boundaries where the physical becomes virtual and anything virtual can become physical, in a activist continuum. It is this mingle of realtime, archive and memory held within our body that enables us to perceive and understand the blur of multiple realities.

Throughout her presentation and her concept of the hyper-sensory self, Ghislaine will guide us through some future body-centered scenarios including the Internet of Bodies, 24/7 virtual/physical collaboration, wearables and future biometric implants live feed.
